## PGM credit goes to Kuhmo

The potential for the Kuhmo nickel project to provide substantial PGM credits to Vulcan Resources Ltd was further enhanced in September when drilling confirmed further high-grade results from the Hietaharju nickel sulphide deposit.

Holes **HIE-27** and **HIE-28** returned multiple zones of shallow sulphide mineralisation, including a hit of 5m @ 2.1% nickel, 1.5% copper, 3.7 g/t palladium and 2.7 g/t platinum.

Managing director Alistair Cowden said the continued receipt of high values from shallow drilling reaffirmed the company's view of the likelihood for resource upgrades and resource growth at Hietaharju.

"We intend to complete systematic, shallow infill and extension drilling on all six known deposits, extensive metallurgical testwork and resource modelling. Scoping studies will commence later this calendar year," Cowden said.

Hietaharju is the second most advanced of six nickel sulphide deposits Vulcan has identified at Kuhmo, and the company said metallurgical testwork, already started at the Peura-aho deposit, would begin at Hietaharju shortly.

Vulcan now plans to use "deep-looking" EM techniques for the first time in Finland as it seeks to identify extensions of the 12 known sulphide occurrences in the area.
